01 | THE DECISION

Own the intelligence, orchestrate the rest — the disciplined path a capital-constrained ScaNxt can actually fund

ScaNxt
WHERE AGRICULTURE MEETS TECHNOLOGY

WHAT WE ASK THE BOARD TO APPROVE

Make AI-first intelligence the core (Path B), delivered through partners and government rails (Path A), with manufacturing and mechanisation licensed or rented while ScaNxt retains the device IP and the intelligence. A three-year, gate-governed path from ₹1.86 cr to ₹25 cr that never bets the company on a factory.

Four directions pull at once — hardware, AI intelligence, partner scale, full mechanisation.
We choose one engine, one channel, and defer the rest.

ENGINE
Path B · AI-first intelligence
Recurring, scalable — compounds with every test

CHANNEL
Path A · partner-led scale
VLEs, FPOs and government as the low-cost last mile

DEFERRED
Path C · integrated, capital-heavy
Manufacturing & mechanisation licensed or rented until the gates are met

THE BALANCE SHEET IS THE ARGUMENT

₹1.86 cr
FY25 revenue base (case)

₹1 cr
active bank borrowing — Punjab National Bank, 31 Dec 2025
Tracxn Loans & Charges record; external source, not a case fact

A company this size cannot fund a factory, own distribution and out-spend a far better-funded global rival at once.
It can own the one thing that needs no factory: the data, the models and the farmer engagement layer.

Asset-light is not a preference.
It is the disciplined path the balance sheet supports.

OWN · what compounds and can't be copied
- India-calibrated soil & pest data + the models trained on it
- Bhu-Parikshak device IP & spectral R&D
- the recommendation engine
- the farmer intelligence & engagement layer
- the orchestration layer

RENT · everything capital-heavy
- Contract manufacturing
- distribution via FPOs & agribusiness
- device and mechanisation finance via banks / NBFCs
- EV tractors & robotics via the CSIR transfer and subsidised Custom Hiring Centres
- last-mile reach on government schemes (SHC, VLSTL)

Diagnose → Recommend → Fulfil → Execute → Learn: one loop — a rival can copy a box, not the loop.
Hardware can be copied. Embedded intelligence + trust is harder to replicate. We own the thin layer that compounds with every test, and rent every layer that needs a balance sheet we do not have.

1 · 0–12 MONTHS · PROVE — ₹3–4 cr
3-district Punjab / Haryana / W. UP pilot — worst over-application (254 vs 147 kg/ha national) and the highest farm incomes · ICAR validation on N + organic carbon · data-rights clause in every contract

2 · 12–24 MONTHS · SCALE — ₹7 cr
~300 VLEs on subsidised devices · onto SHC & RKVY panels · paid advisory launched

3 · 24–36 MONTHS · MONETISE — ₹25 cr
First lender / insurer data contract · pest layer added · EV tractor licensed as royalty

02 | THE POLYCRISIS, REASSESSED

Six shocks are not six problems — they close one trap, and asset-light data ownership is the one door out

ScaNxt
WHERE AGRICULTURE MEETS TECHNOLOGY

SHOCKS 2 + 3
AI + hardware commoditise
Defensibility must move beyond the device — to proprietary data, workflow and field access

→

WHICH MEANS
All three need field access
And field access means PARTNERS — governments, FPOs, VLEs

→

WHICH TRIGGERS SHOCK 5
Last-mile dependence
The same partners can own the farmer and the behavioural data that IS the moat

→

SHOCKS 1 + 6
Capital and execution bar the exits
Can't afford full-stack; can't own the whole last mile — the trap is closed

THE ONE DOOR OUT — asset-light data ownership: own the data and the farmer engagement layer, keep physical access through partners by contract, rent everything heavy.
We did not build a strategy and then test it against the shocks — the shocks are the reason the strategy is what it is.

1 ADVERSITY 1
If commoditisation kills the moat before the data compounds

Cheap sensors plus free foundation models reproduse our diagnosis and advice, and a far better-funded rival — CropX, now holding SCIO's 44 NIR patents — undercuts us before India-calibrated data becomes a real moat.

EARLY WARNING — watch
- Device gross margin below plan for 2 consecutive quarters
- A sub-₹50k rival NIR device launches in India
- Device-attach on new farmers drops >15% YoY
- A free foundation-model soil advisor reaches farmers in Hindi / regional languages

PRE-COMMITTED RESPONSE — then
- Accelerate the shift from device revenue to advisory + marketplace
- Bundle device with advisory so the relationship, not the box, is the product
- Deepen what can't be copied: per-agro-zone calibration + ICAR-validated model
- Lock outcome-linked data rights with top partners early, ahead of the threat

2 ADVERSITY 2
If the last mile takes the farmer — and the data — from us

Reach depends on partners. The same VLEs, FPOs and agencies can own the farmer relationship and the behavioural data; if a large federation goes direct with our playbook, our channel becomes our competitor and the moat drains away.

EARLY WARNING — watch
- VLE 12-month churn above 20% for 2 consecutive quarters
- Data flow-back below 80% of active devices syncing
- A partner requests raw, not aggregate, data rights
- A large FPO federation launches its own testing / advisory offer

PRE-COMMITTED RESPONSE — then
- Strengthen the hub: working capital, servicing, year-round VLE income
- Enforce sync-to-platform architecture — the device writes to our cloud by design
- Every MoU assigns ScaNxt the aggregated-data rights as the price of joining
- Anchor the farmer with the advisory subscription, not the one-off test

All six shocks, one posture — asset-light data ownership. **Trigger rule:** any 2 indicators persisting 2 consecutive quarters → board review of pace and channel mix.
Thresholds are our proposed decision rules, not case facts.

Capital pressure	AI commoditisation	Hardware commoditisation	Climate volatility	Last-mile dependence	Execution complexity
No build · 3 states · sequence revenue	Cheap AI raises the value of our data	Near-cost device; monetise the advice	Per-zone recalibration + pest alerts	Data by contract + sync-by-design	Deferred: licensed, never owned

03 | THE MONEY

₹1.86 cr → ₹25 cr: the engine shifts to recurring revenue, the unit economics hold, and the plan survives the downside

Revenue by stream (₹ cr · illustrative mix on case anchors)

Revenue stream	Y0	Y1	Y2	Y3
Device & test fees	1.30	2.60	4.20	6.00
Advisory subscriptions	0.10	1.50	4.00	7.50
Marketplace & data	0.06	0.90	3.00	6.50
Institutional & analytics	0.40	1.80	3.50	3.00
Tractor royalty (licensed)	0.00	0.20	0.80	2.00
TOTAL	**1.86**	**7.00**	**15.50**	**25.00**
Recurring % (advisory + mktpl.)	**9%**	**34%**	**45%**	**56%**

Device & test fees fall from 70% of revenue to 24%; advisory + marketplace rise from 9% to 56%. No single stream reaches ₹25 cr — the mix does the work. The farmer still pays ~₹1,000 a year; ₹25 cr comes from more VLEs, not a higher price — roughly 2.5 lakh farmers, about 2.5% of the 10-million ambition. Year 1 is Project Navjeevan, the 3-district pilot that proves the loop and funds the data corpus.

Unit economics — no hardware-heavy acquisition engine needed

Per unit / year	Farmer	FPO / inst.	VLE
Revenue to ScaNxt	₹500	₹2,00,000	₹1.5 L*
Gross margin	72%	55%	channel
Acquisition cost	₹200	₹25,000	₹20,000
Annual churn	30%	12%	hub-supported
Lifetime value	₹1,200	₹9.2 L	—
LTV : CAC	**6.0x**	**36.7x**	**—**
Payback	**6.7 mo**	**<3 mo**	**1 season**

Farmer CAC is small because VLEs acquire farmers — not paid marketing. 30% farmer churn is deliberately conservative; institutions are stickier and anchor the base. Both segments stay contribution-positive under these assumptions. * ₹1.5 L is direct channel revenue per VLE; the sensitivity opposite counts the downstream farmer revenue each VLE activates (advisory + marketplace across ~800 farmers), so 100 fewer VLEs cost ~₹3.8 cr.

Stress test — Y3 under pressure

Scenario	Y3 revenue
Downside — slow VLE ramp, no tractor	₹15.5 cr
Base case	**₹25.0 cr**
Upside — fast adoption + data deals	₹30.0 cr

Biggest levers — one-at-a-time Y3 impact

VLE count 300 → 200	–₹3.8 cr
ARPU ₹1,000 → ₹700	–₹2.2 cr
Marketplace take 6% → 4%	–₹2.1 cr
Tractor gate never opens	–₹2.0 cr

The downside removes VLE speed and tractor upside — not the strategy: the recurring-revenue transition still happens and capital-heavy Path C is still avoided. The biggest lever is VLE recruitment, which is why this is a distribution machine, not a technology bet.

All unit economics, scenarios and the stream split are benchmarked model assumptions, not case facts. Anchors: the case's ₹1.86 cr base, ₹190 per government sample, 5–8% marketplace take, and the founder's public figures (₹400–500 a year for a 12–13% productivity gain). Rural CAC and churn benchmarked to CSC / DeHaat agent networks.

> *"Technology should not replace the farmer's wisdom; it should strengthen it."* — *Founder & CEO, ScaNxt*

Can ScaNxt use a polycrisis to become more focused, more defensible and more scalable?

Yes. The polycrisis is not the threat — it is the forcing function. It strips away every path a company with this little capital could never afford, and leaves standing the one thing that compounds: India-calibrated data and the farmer's trust. The polycrisis does not force ScaNxt to do more. It gives ScaNxt permission to do less, better.

APPENDIX

Sources & Evidence

Every number in the three slides, traced to its source — and what is a stated fact versus a benchmarked assumption.

Team KAS · Abha Nayyar · Kishore Kunal · Sakshi Lata · MDI Gurgaon

APPENDIX

Sources & Evidence

HOW TO READ THIS APPENDIX

Three kinds of number — and we label every one

Every number in the three slides, traced to its source — and what is a stated fact versus a benchmarked assumption.

STATED FACT

From the case or an official public source.

From the case document or an official public source. Non-negotiable.

Examples:

- ₹1.86 crore revenue base (case)
- ₹190 per government sample (case)
- 348 million tests needed (case)

SOURCE-CHECKED

Verified against a named database or report.

A public figure we verified against a named database or report.

Examples:

- NPK ratio 9.29:3.52:1 (published studies)
- Punjab 253.9 kg/ha (state government data)
- CropX $51.4 million raised (press reports)

BENCHMARKED ASSUMPTION

Our estimate, derived from anchors and market benchmarks.

Our estimate, derived from anchors and flagged as such. Validated in the pilot.

Examples:

- Farmer ARPU ₹1,000 (benchmarked)
- CAC ₹200 (benchmarked)
- Churn 30% (benchmarked)
- Revenue stream split (benchmarked)

The honesty principle: we never present an assumption as a fact. Where we estimate, we say so — and Project Nava jagaran, the Phase-1 pilot, exists to validate the assumptions before any scale-up.

SOURCES BEHIND SLIDE 1 — THE DECISION

The company, the market, the balance sheet

Claim / figure used	Source	Year
₹1.86 cr FY25 revenue base	ScaNxt case document (SAMVAAD 2026)	2026
~₹1 cr Punjab National Bank borrowing	MCA corporate filings, via Tracxn	FY24–25
21 states + 7 countries; 650,000+ tests; 90,000+ farmers; 300+ partners	ScaNxt company materials / Sankalp Forum profile	2026
Bhu-Parikshak device IP; spectral sensing tech	IIT Kanpur technology-transfer MoU (Prof. J.K. Singh)	Nov 2024
EV tractor via CSIR-CMERI / NRDC technology transfer	Vigyan Tech 2026 MoU announcement	May 2026
VLSTL scheme: **up to 75%** state funding for village labs	Soil Health Card scheme, VLSTL guidelines (PIB)	Jun 2023
Soil Health Card — **₹190** per government sample	Dept. of Agriculture & Farmers Welfare / PIB	2025

SOURCES BEHIND SLIDE 2 — THE POLYCRISIS

Competitors, commoditisation, and the soil crisis

Claim / figure used	Source	Year
CropX — **$51.4 M** raised, 9 rounds, 8 acquisitions, #2 of 2,130	Tracxn competitor database	2026
CropX acquired SCIO (portable NIR, **44 patents**)	CropX / SCIO public deal disclosure	26 Aug 2026
Trace Genomics — **$53.6 M** raised, acquired by **Miraterra**	Tracxn; Miraterra acquisition release	Jul 2025
Krishitantra — $1.18 M raised; **₹2.57 cr FY25 revenue**	Tracxn; MCA filings	2020 / FY25
Stenon — **€18 M Series B** (soil data infrastructure)	Company funding announcement	Jul 2026
Organic carbon fell **~1% → 0.3%** in a decade; **170+ countries degrading**	ScaNxt founder, public interview	2026
Agritech funding fell **~30%** (2023 → 2025)	Tracxn / industry funding data	2025

SOURCES BEHIND SLIDE 3 — THE MONEY

Anchors that ground the model — and the assumptions we flag

THE REAL ANCHORS
(stated / source-checked)

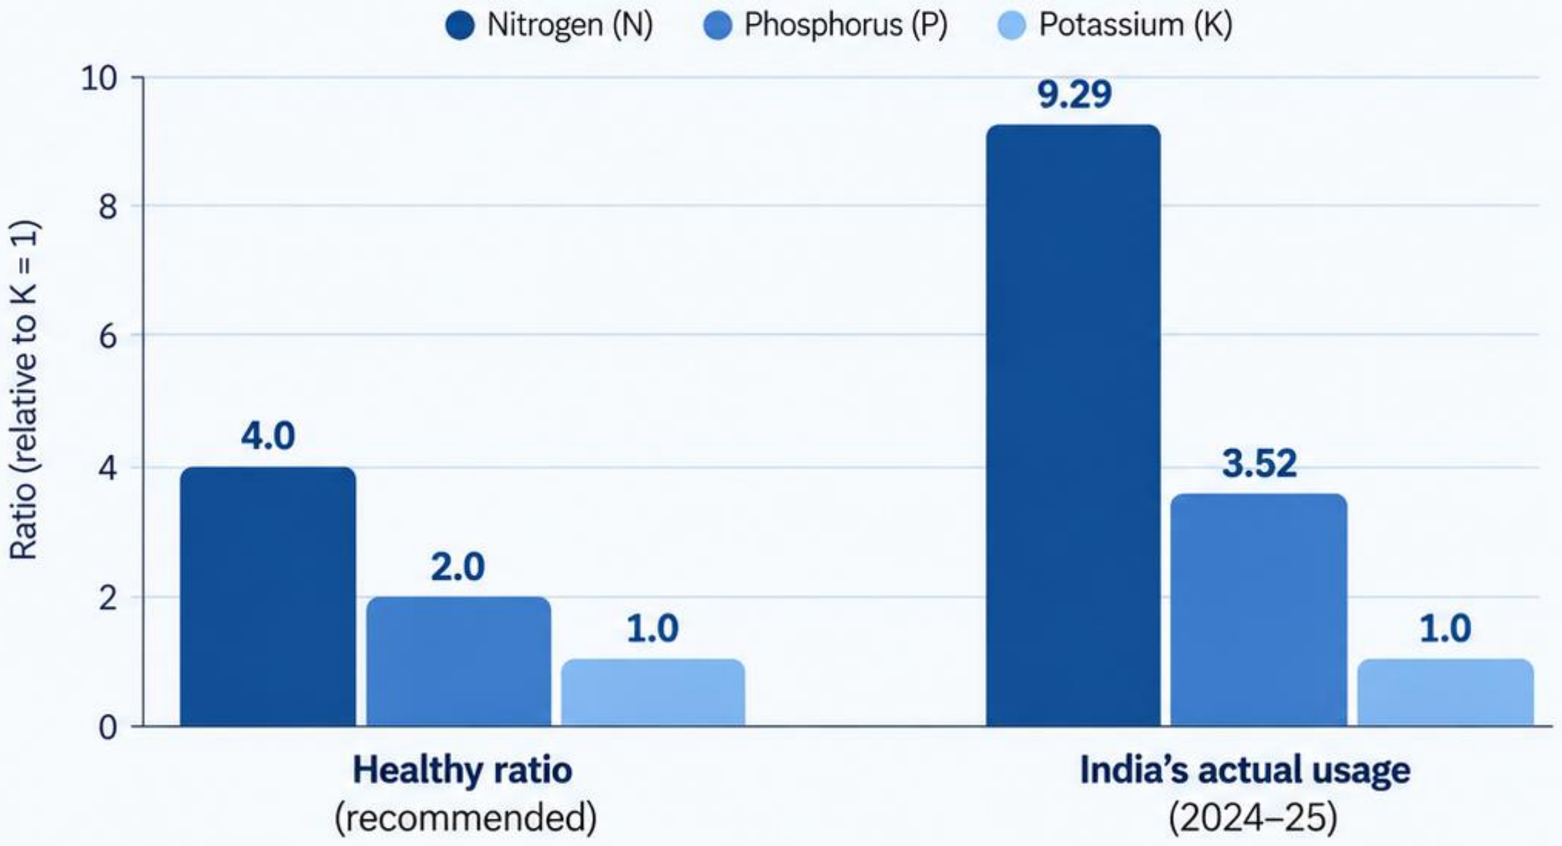

₹1.86 cr revenue base	*Case document*
₹190 per soil sample	*Govt / PIB*
Device ₹1.17 L; 90 sec/test; 50,000-test life	*IIT-K / IndiaMart*
75% VLSTL device subsidy	*SHC / PIB*
Farmer **12–13% yield gain** for ₹400–500/yr; 25% lower pesticide cost	*ScaNxt founder, public interview*
5–8% marketplace take-rate	*Industry dealer-margin benchmark*

THE ASSUMPTIONS
(benchmarked, to validate)

Farmer ARPU ~₹1,000/yr	*2 tests + advisory build-up*
50:50 farmer-spend split (VLE : ScaNxt)	*Channel-economics judgment*
Farmer CAC ~₹200	*₹50k agent ÷ ~300 farmers*
Farmer churn 30% (pessimistic)	*CSC / DeHaat rural-agent data*
Institution rev ₹2 L, churn 12%, CAC ₹25k	*B2B sales judgment*
Per-stream revenue split (Y0–Y3)	*Our mix judgment — direction, not precision*

EVIDENCE IN ONE CHART — THE NUTRIENT IMBALANCE

India uses more than double the nitrogen the soil should get

What it shows

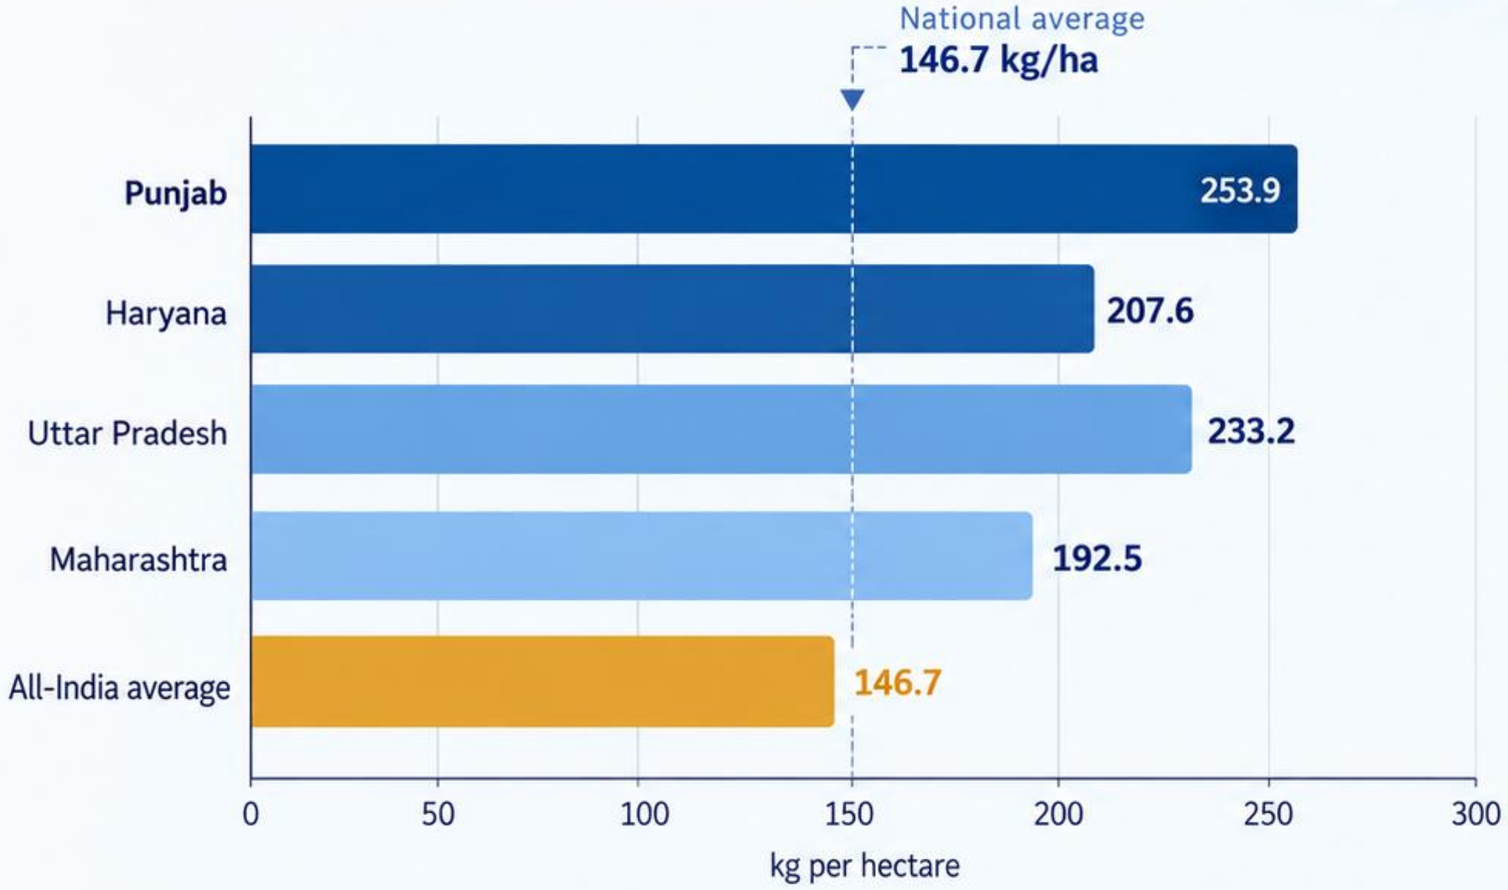

The healthy N:P:K ratio is **4:2:1**.
India actually uses **9.29:3.52:1** — **more than double the nitrogen** it should.

The problem is not too little fertiliser; it is the wrong mix. That is exactly what a per-plot recommendation fixes.

Balanced, plot-specific recommendations can correct this nutrient imbalance.

Source: IndiaStat / Fertiliser Association of India, N:P:K consumption 2024–25.

Over-application per hectare — worst where we start

The three-axis logic

Punjab (254) and Haryana (208) use far more than the 147 national average — so **the wasted spend a farmer can save is largest here.**

These same states are worst on organic-carbon depletion, and their farmers earn the most (₹26,701 / ₹22,841 a month), so they can pay. Pain, depletion and ability-to-pay converge on one beachhead.

Sources: Lok Sabha / IndiaStat (per-hectare); NSS 77th round (incomes).

MASTER SOURCE LIST

Every source, in one place

Case & company

ScaNxt documents, materials and primary sources

ScaNxt case document	SAMVAAD 2026
ScaNxt company materials / Sankalp Forum	2026
ScaNxt founder public interview	2026

Research & databases (MDI library)

Market data, competitor set, industry reports

Tracxn (funding, competitor set, MCA filings)	2026
IndiaStat / FAI (NPK, fertiliser data)	2024–25
Behera et al., Indian Journal of Fertilisers	2025
CMIE Industry Outlook (tractor/machinery)	2026

Government & policy

Schemes, guidelines and official data

Soil Health Card scheme / PIB	2023–25
VLSTL lab-subsidy guidelines	Jun 2023
Lok Sabha replies (per-hectare, farm power)	2024
NSS 77th round (farmer incomes), MoSPI	2021

Technology & deals

MoUs, funding announcements and deal disclosures

IIT-Kanpur tech-transfer MoU	Nov 2024
CSIR-CMERI / NRDC EV-tractor MoU	May 2026
CropX / SCIO deal disclosure	Aug 2026

A NOTE ON RIGOUR

We built from anchors, and we flag every estimate.

Where the case or an official source gives a number, we used it. Where we had to estimate — farmer ARPU, acquisition cost, churn, the revenue mix — we derived it from those anchors, benchmarked it to comparable rural networks, and said so on the slide. Project Navjagaran, the three-district Phase-1 pilot, exists to turn those assumptions into evidence before a single rupee is scaled.

USE OFFICIAL SOURCES

Where the case or an official source gives a number, we used it.

ESTIMATE WITH ANCHORS

Where we had to estimate, we derived it from those anchors and benchmarked to comparable rural networks.

VALIDATE BEFORE SCALE

Project Navjagaran, the three-district Phase-1 pilot, exists to turn those assumptions into evidence before a single rupee is scaled.

TEAM KAS · MDI GURGAON
